fortaccartreaagreegeacececartrtrtrtrtrtrtrtrtr 3'],
double-stranded cDNA was size selected, ligated to Eco RI
adapters (Pharmacia), digested with Not I and cloned into
the Not I and Eco RI sites of a modified pr7r3 vector
(Pharmacia). Library went through one round of
normalization to a Cot = 5. Library constructed by Bento
Soares and M.Fatima Bonaldo. RNA from 4 multiple sclerosis
lesions from one patient was kindly provided by Dr. Kevin
G. Becker (NINDS/NIH).

/clone_lb="Gm-close" conc. Do. on the cotyledons"
/lab_host="whole seedling without cotyledons"
/lab_host="bluescriptii SK+; Site_l: EcoRi; Site_2:
/note="Vector: pBluescriptii SK+; Site_l: EcoRi; Site_2:
Xhoi; This cDNA library was constructed from mRNA isolated
from 2 week old seedlings with the cotyledons removed at
the time of harvest. The seedlings for the cultivar Ogden
were grown in a growth chamber using germination paper.
Complementary DNA was synthesized from mRNA using a primer
consisting of a poly(dT) sequence with a Xhoi restriction
site. EcoRi adapters were ligated to the blunt-ended cDNA
fragments followed by Xhoi digestion. The cDNA fragments
were directionally cloned into the EcoRi-Xhoi restriction
site of the pBluescript vector. The ligated cDNA fragments
were transformed into DH10B host cells (Gibco BRL). This
library was constructed by Dr. Randy Shoemaker."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caenorhabditis elegans.

/note="Organ: mixed (see below); Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco RI: Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbH10, and fetal heart NbH110H) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries: The pools consisted of I.M.A.G.E. clones 260232-265223,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryotta; Viridiplantae; Embryophyta; Tracheophyta; Spermatophyta; Bukaryotta; Viridiplantae; Embryophyta; Tracheophyta; Spermatophyta; Pabaleas; Pabaceae; Papilionoideae; Glycine.

                                                  The sequence is that of the gene encoding a glyphosate oxidoreductase (GON) enzyme, the gene sequence was synthesised so that it could be redesigned to eliminate as much as possible the following sequences or redesigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + C% for the synthetic gene is 51% and the potential to form short, high energy, hair-pin structures is reduced. However it still encodes the wild type GOR enzyme. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops.

                                                                                                                                                                                                                                                                                          6
                                                                    This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

Inducible promoter linked to a gene (I) that confers resistance to a herbicide, is calaimed. (I) imparts resistance to a herbicide, is calaimed. (I) imparts resistance to N-phosphonomethyl-c glycine (glyphosate) or its salts, but may also be a gene for resistance to, e.g. chloroacetanilides, glufosinate, sulphonyl ureas, imidazolones, to, e.g. chloroacetanilides, glufosinate, sulphonyl ureas, imidazolones, cetc. The inducible promoter (e.g. alcA, alcR, aldA or other alcR-induced expression of (I) avoids the risk that constitutive expression interfere with plant development; allows volunteer plants to be controlled by herbicide applied without inducer and minimises the chance that herbicide resistant strains of weeds will arise. The expression cassette is strictly controlled and suitable for general use in plants (both mono- and dicotyledons). The alcA/alcR gene switch was used to drive inducible expression of glyphosate oxidase (GOX) in plants. Switchable GOX was expressed alone or in conjunction with constitutive expression of 5-enol-pyruvylshikimate 3-phosphate (BPSPS) CP4. Constructs were optimised for expression in mono- and dicotyledonous crop species. The present sequence comprises a fusion of the GOX gene fused to the chloroplast transit sequence a from Arabidopsis RUBISCO (CPT1). This
     avoids constitutive expression and minimises development
                                                                              Example 3; Fig 7; 59pp; English.
                            herbicide tolerant weeds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cot vectors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ÷
                                                                                                                                                                                                                                                                                                                                                          The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been modified using mutagenic primers. The gene sequence was redesigned to eliminate as much as possible the Gollowing sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of S or more: A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + Cs of the GOR gene was reduced from 56% in the manipulated version (120833) to 52% in the modified version. However it still encodes the wild type GOR enzyme. It was obtd. From bacterial isolate LBAA.

It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops.

                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been manipulated such that it is suitable for introduction into and expression in plant transformation vectors, but it still encodes the wild type GOR enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. See also Q20832-Q20841 and Q22705.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields conty. Crops. This sequence (fig 2) contains apparent discrepancies (see feature table) with a supposedly identical sequence (SEQ ID No.3 in the specification), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                             here"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. This sequence (SEQ ID No.3 in the specification) contains apparent discrepancies (see feature table) with a supposedly identical sequence (fig 2), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      atocoggattogotococgtgattggccgggcaacccggacacccgacgtaatctatgct 1.256
                                                                                 This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvishikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capa of tolerating herbicide treatment with allyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ATGCCTGAGAACCACAAGAAGGTTGGTATCGCTGGAGCTGGAATCGTTGGTGTTTGCACT 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       540
                                                                                                                                                                  This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capa of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                       9

```
This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF69, KI2 which encodes immediate early protein (IEP), KI4 which encodes (ORF73 which encodes cyclin D, ORF73 which encodes (Protein Coupled receptor, ORF75 which encodes (ORF73 which encodes (ORF75 which encodes (ORF7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kaposi's sarcoma; acquired immune deficiency syndrome; AIDS; DHFR; Bcl-2; dihydrofolate reductase; LUR; long unique region; vaccine; prophylaxis; diagnosis; treatment; HHV8; capsid protein IV; tegument protein IV; 91ycoprotein; kaposin; cyclin D; immediate early protein; IEP; OX-2; v-adh; G-protein coupled receptor; FGARAT; ds.

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known as human herpes virus 8 (HHWA). This sequence contains the DNAs of the invention which encode KSHV polypeptides selected from: (a) viral complement broad protein; glycoproteins B, Mor L; (c) viral IRF1. (d) complement binding protein; glycoproteins B, Mor L; (d) capsid protein; glycoproteins B, Mor L; (d) capsid protein; lycoproteins B, Mor L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the proteins are useful for detecting HHVB, specific for the proteins are useful for detecting HHVB, specifically for diagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHVB infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHVB infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHVB may be implicated in many other lymphoproliferative diseases such as lymphomas, leukaemia, containing the concentrative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the cused as targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methotrexate. These can also be used to determine the immune status of a patient infected with HTV HHVB derived protein propertion and an animal for the immune status of a patient infected with HTV HHVB derived protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         viral MIP III may be used as an anti-inflammatory agent for, e.g. treating rheumatoid arthritis. This sequence is stated as containing

SCAIII gene containing 73 copies of the trinucleotide (CAG) repeat unit (the present sequence) to a substrate, and hybridising with amplified testee genomic DNA containing copies of the trinucleotide units, PCR amplified with labeled primers (X8989-90). The new method is useful for diagnosis of SCAIII syndrome, and for determining the severity of the disease. The present sequence represents the SCAIII gene fragment containing 73 trinucleotide (TNR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             965

gene. The human OPA gene is derived from the PCTG4 region of chromosome xq13. Polymorphisms in this region are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroidism. One 12 bp insertion polymorphism occurs within the coding region of the human OPA gene, and introduces a 4 amino acid insertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another polymorphism consists of a pentanucleotide repeat approximately 7 kb upstream of the 12 bp polymorphism. Another polymorphisms consists of a dinucleotide repeat approximately 4.5 kb downstream of the 12 bp polymorphism. Another polymorphisms consists of a dinucleotide repeat specification describes a method for screening for polymorphisms in a PCTG4 nucleic acid sequence obtained from a subject. The PCTG4 related sequences within the q13 region of the X chromosome have polymorphisms associated with neuropsychiatric disorders. The methods can be used to screen for the presence of a heritably linked form of mental the chromosial.

The present sequence represents the CDNA sequence of the human OPA gene, which is derived from the human PCTG4 region of chromosome Xq13. Polymorphisms in this region are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroidism.

Cone 12 bp insertion polymorphism occurs within the coding region of the human OPA gene, and introduces a 4 amino acid insertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another polymorphism consists of a pentanucleotide repeat approximately 7 kb upstream of the 12 bp polymorphism. Another polymorphisms consists of a dinucleotide repeat approximately 4.5 kb downstream of the 12 bp polymorphisms. The specification describes a method for screening for polymorphisms in a PCTG4 nucleic acid sequence obtained from a subject. The PCTG4 related sequences within the q13 region of the X chromosome have polymorphisms associated with the research of the X chromosome have polymorphisms associated with presence of a heritably linked form of mental retardation, autism, certain affective disorders or hypothyroidism.

```
A synthetic gene (T13952) comprises a version of the Bacillus cereus strain AB78 80-kDa VIPIA(a) gene (see also T13941) with codon usage optimised for expression in maize. The synthetic gene encodes VIPIA(a) (R91240), an insect-specific protein showing activity against western corn rootworm. VIPIA(a) can be expressed in transgenic maize to protect the plant from insect attack.
                                                                                                                             Bacillus strain producing insecticidal protein during vegetative growth - used in the control of Lepidoptera and Coleoptera pests % \left( \frac{1}{2}\right) =0

Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at
http://www.genoscope.cns.fr/Tetraodon.

- Gollaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDCP is constructing a physical map of the Drosophila
melanogaster genome using these BACs. For further information
please see http://www.fruitfly.org The BDCP Drosophila
melanogaster BAC ilbrary was prepared by Kazutoyo Oscegawa and
Aaron Mammoser in Pieter de Jong's laboratory in the Department of
Cancer Genetics at the Roswell Fark Cancer Cittute in Buffalo,
NY. The library is named RPCI-98 and was constructed by partial
ECORI digestion of Drosophila DNA provided by the BDCP from the
isogenic strain v2s: on bw sp, the same strain used for the BDGP's
pl and EST libraries. A more detailed description of the library
and how to order individual BAC clones, the entire library or
fillters for hybridization from the BACPAC Resource Center can be
found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
